

■ COMPLETE NOTES — EXPANDED EDITION

HTML Semantic Tags & Meta Tags

Full Explanation — CodeWithHarry Sigma Web Dev Course

Yeh notes tumhare existing Day 10 PDF ka extended version hai. Semantic Tags aur Meta Tags ko is baar poori depth mein explain kiya gaya hai — har tag ka purpose, use case, aur real examples ke saath.

PART 1 — SEMANTIC HTML TAGS

Semantic Tags kya hote hain?

Semantic matlab hota hai — **meaningful**. Semantic tags woh HTML elements hain jinka naam dekh ke hi pata chal jaata hai ki woh kya kaam karte hain. Jaise **<header>** clearly bolta hai 'yeh page ka header hai', aur **<nav>** bolta hai 'yeh navigation hai'.

Iske ulta non-semantic tags hain jaise **<div>** aur **** — inhe dekh ke kuch pata nahi chalta ki andar kya hai.

Non-Semantic (Bad)	Semantic (Good)
<code><div id='header'></code>	<code><header></code>
<code><div id='nav'></code>	<code><nav></code>
<code><div id='main'></code>	<code><main></code>
<code><div id='sidebar'></code>	<code><aside></code>
<code><div id='footer'></code>	<code><footer></code>

3 Main Benefits of Semantic HTML

- 1. SEO (Search Engine Optimization):** Google aur doosre search engines semantic tags padh ke samajhte hain ki page ka important content kahan hai. `<h1>` heading, `<article>` ka content — yeh sab Google rank karte waqt consider karta hai.
- 2. Accessibility:** Screen readers (jo blind logo ke liye hote hain) semantic tags se samajhte hain ki kahan kya hai. `<nav>` pe screen reader bolta hai 'Navigation area' aur user directly wahan ja sakta hai.
- 3. Code Readability:** Team mein kaam karte waqt dusra developer seedha samajh jaata hai ki `<header>` mein kya hoga bina comments padhe.

`<header>` — Page/Section ka Top Area

Page ka sabse upar wala hissa — generally logo, site ka naam, aur navigation hota hai. Sirf page ka hi nahi, `<article>` ya `<section>` ka bhi header ho sakta hai.

```
<header>
<h1>Meri Website</h1>
<nav>...</nav>
</header>
```

■ Tip: header ek page mein multiple baar use ho sakta hai — har section ka apna header ho sakta hai.

`<nav>` — Navigation Links

Website ke main navigation links yahan aate hain — menu, breadcrumbs, pagination. Har links ka group `<nav>` nahi hota — sirf important navigation ke liye use karo.

```
<nav>
<a href='/'>Home</a>
```

```
<a href='/about'>About</a>
<a href='/contact'>Contact</a>
</nav>
```

■ Tip: Footer mein bhi ek alag <nav> ho sakta hai — ek page mein multiple <nav> allowed hain.

<main> — Page ka Primary Content

Page ka sabse important content yahan hota hai. Ek page mein sirf EK <main> tag hona chahiye. Header, footer, aur sidebar is mein nahi aate — sirf main content.

```
<main>
<article>...</article>
<aside>...</aside>
</main>
```

■ Tip: <main> sirf ek baar per page — yeh rule strictly follow karo!

<article> — Self-Contained Content

Aisa content jo apne aap mein complete ho aur independent ho — blog post, news article, product card, comment. Agar content ko page se hatakar kisi aur jagah publish kar sako aur woh still make sense kare — toh <article> use karo.

```
<article>
<h2>Blog Post Title</h2>
<p>Post content...</p>
<footer>Published by Shauray</footer>
</article>
```

■ Tip: <article> ke andar bhi <header> aur <footer> ho sakta hai — apna own header/footer!

<section> — Thematically Grouped Content

Related content ka group — jaise ek page pe 'About', 'Services', 'Contact' alag alag sections hote hain. Section mein hamesha ek heading (h2/h3) honi chahiye. <div> aur <section> mein yahi fark hai.

```
<section>
<h2>Hamare Services</h2>
<p>Hum yeh services dete hain...</p>
</section>
```

■ Tip: Section vs Article: Section ek page ka part hai, Article ek independent piece of content hai.

<aside> — Supplementary Content

Main content se related lekin directly part nahi — jaise sidebar, related articles, ads, tips, author bio. Physically page ke side mein hona zaroori nahi — semantically 'extra info' ke liye hai.

```
<aside>
<h3>Related Topics</h3>
<ul>
<li>CSS Basics</li>
<li>JavaScript</li>
</ul>
</aside>
```

■ Tip: Google <aside> content ko main content se kam important maanta hai — SEO ke liye dhyan rakho.

<footer> — Page/Section ka Bottom Area

Page ka sabse neecha hissa — copyright, contact info, social links, sitemap. Header ki tarah footer bhi multiple baar use ho sakta hai — har section/article ka apna footer.

```
<footer>
<p>&copy; 2026 Meri Website</p>
<address>
<a href='mailto:me@example.com'>Contact</a>
</address>
</footer>
```

■ Tip: Footer mein <address> tag use karo contact info ke liye — yeh bhi ek semantic tag hai!

<figure> + <figcaption> — Media with Caption

<figure> kisi bhi media content ko wrap karta hai — image, video, code snippet, diagram. <figcaption> us media ka description/caption hota hai. Inhe saath use karo — akele nahi.

```
<figure>
<img src='chart.jpg' alt='Sales Chart'>
<figcaption>Fig 1: 2026 Sales Data</figcaption>
</figure>
```

■ Tip: Search engines <figcaption> ko image description ki tarah bhi padhte hain — SEO boost!

<details> + <summary> — Collapsible Content

<details> ek collapsible section banata hai — click karo toh expand ho, dobara click karo toh band. <summary> uska visible title hota hai jo hamesha dikhta rehta hai. FAQ sections ke liye perfect!

```
<details>
<summary>CSS kya hai? (click karo)</summary>
<p>CSS matlab Cascading Style Sheets...</p>
</details>

<!-- 'open' attribute se default open -->
<details open>
<summary>Yeh pehle se open hai</summary>
<p>Content...</p>
</details>
```

■ Tip: JavaScript ke bina hi collapsible content — sirf HTML se! Beginners ke liye bahut useful.

<time> — Date aur Time

Date ya time ko machine-readable format mein likhne ke liye. User ko normal text dikhta hai, lekin browser/search engine datetime attribute se exact date/time samajhta hai.

```
<!-- Date -->
<time datetime='2026-04-21'>21 April 2026</time>

<!-- Time -->
<time datetime='14:30'>2:30 PM</time>

<!-- Date + Time -->
<time datetime='2026-04-21T14:30'>21 April, 2:30 PM</time>
```

■ Tip: Google search results mein 'Published on' date dikhta hai — <time> tag se yeh possible hota hai!

<mark> — Highlighted Text

Kisi important word ya phrase ko highlight karne ke liye — default mein yellow background aata hai. Search results mein searched word highlight karna ho, ya kisi important term pe dhyan dilana ho.

```
<p>HTML mein <mark>semantic tags</mark> bahut important hain.</p>

<!-- Search result mein -->
<p>Result: <mark>HTML</mark> ek markup language hai.</p>
```

■ Tip: <mark> ka use sirf highlighting ke liye — bold ya important text ke liye use karo.

<address> — Contact Information

Kisi author ya organization ki contact information ke liye — email, phone, physical address. Yeh automatically italic mein render hota hai. <footer> ke andar use karna best practice hai.

```
<address>
Written by <a href='mailto:shauray@example.com'>
Shauray Sharma
</a><br>
Gaya, Bihar, India
</address>
```

■ Tip: <address> sirf physical address ke liye nahi — kisi bhi contact info ke liye use kar sakte ho.

<progress> + <meter> — Values Display

<progress> kisi task ki completion dikhati hai (loading bar jaisa). <meter> ek known range mein measurement dikhati hai (disk usage, ratings). Dono alag purpose ke liye hain.

```
<!-- Progress: task completion -->
<label>Course progress:</label>
<progress value='75' max='100'>75%</progress>

<!-- Meter: known range measurement -->
<label>Rating:</label>
<meter value='4' min='0' max='5' low='2' high='4' optimum='5'>
4 out of 5
</meter>
```

■ Tip: Progress vs Meter: Progress = kuch complete ho raha hai, Meter = ek value ek range mein hai.

Semantic Tags — Quick Reference Table

Tag	Kahan Use Karo	Kitni Baar per Page
<header>	Page/section ka top area	Multiple baar ok
<nav>	Main navigation links	Multiple baar ok
<main>	Page ka primary content	Sirf EK baar!
<article>	Independent, self-contained content	Multiple baar ok
<section>	Thematically grouped content	Multiple baar ok
<aside>	Sidebar, related/extra content	Multiple baar ok
<footer>	Page/section ka bottom area	Multiple baar ok
<figure>	Media content wrapper	Multiple baar ok
<figcaption>	Media ka caption	figure ke andar

<details>	Collapsible content	Multiple baar ok
<summary>	Details tag ka title	details ke andar
<time>	Date ya time	Multiple baar ok
<mark>	Highlighted text	Multiple baar ok
<address>	Contact information	Multiple baar ok
<progress>	Task completion bar	Multiple baar ok
<meter>	Range mein measurement	Multiple baar ok

PART 2 — META TAGS (SEO & Page Info)

Meta Tags kya hote hain?

Meta tags woh HTML tags hain jo <head> ke andar likhe jaate hain aur page ke baare mein **information (metadata)** provide karte hain. Yeh tags **user ko directly nahi dikhte** — browser aur search engines inhe padhte hain.

Metadata matlab 'data about data' — jaise ek book ki ISBN number, author, publication date — yeh sab book ka metadata hai. Usi tarah meta tags HTML page ka metadata hote hain.

<meta charset='UTF-8'> — Character Encoding

Browser ko batata hai ki page mein text kaise decode karna hai. UTF-8 duniya ki har language ko support karta hai — Hindi, Arabic, Japanese, Emojis — sab! Yeh tag **SABSE PEHLE** <head> mein aana chahiye.

```
<head>
<!-- SABSE PEHLE yeh likhna hai -->
<meta charset='UTF-8'>
...
</head>
```

■ **Warning:** Agar charset nahi likhte toh Hindi ya special characters broken (???) dikh sakte hain!

<meta name='viewport'> — Mobile Responsive

Mobile devices pe page sahi se scale ho — zoom nahi hoga automatically. Bina iske mobile pe page bahut chota ya bahut bada dikh sakta hai.

```
<meta name='viewport' content='width=device-width, initial-scale=1.0'>

<!-- width=device-width: page ki width = device ki screen width -->
<!-- initial-scale=1.0: default zoom level = 1 (no zoom) -->
```

■ **Tip:** Yeh tag aaj kal EVERY website mein hona chahiye — mobile users 70%+ hain!

<meta name='description'> — Page Description

Google search results mein title ke neeche jo description dikhta hai — woh yahan se aata hai. 150-160 characters mein likho — zyada lamba cut ho jaata hai.

```
<meta name='description'
content='Complete HTML notes for Sigma Web Dev
Course by CodeWithHarry. Day 1 to Day 10.'>

<!-- Google search mein kuch aisa dikhega: -->
<!-- Complete HTML notes for Sigma Web Dev... -->
```

■ Tip: Description mein keywords rakho jo user search kare — isse CTR (click rate) badhta hai!

<meta name='keywords'> — Page Keywords

Page ke relevant keywords — modern Google is tag ko zyada importance nahi deta, lekin likho phir bhi. Comma-separated words likhte hain.

```
<meta name='keywords'
content='HTML, CSS, JavaScript, Web Development,
CodeWithHarry, Sigma Course'>
```

■ Note: Google 2009 se keywords meta tag ignore karta hai (spam tha), lekin Bing/Yahoo abhi bhi dekhte hain.

<meta name='author'> — Page Author

Page kisne likha — author ka naam. Search engines aur RSS readers yeh use karte hain.

```
<meta name='author' content='Shauray Sharma'>
```

■ Tip: Blog posts aur articles mein author meta tag zaroori hai — credibility badhta hai.

<meta name='robots'> — Search Engine Instructions

Search engine bots (crawlers) ko instructions dete ho — page index karo ya mat karo, links follow karo ya mat karo.

```
<!-- Normal pages ke liye (default bhi yahi hai) -->
<meta name='robots' content='index, follow'>
```

```
<!-- Private ya login pages ke liye -->
<meta name='robots' content='noindex, nofollow'>
```

```
<!-- Sirf index karo, links mat follow karo -->
<meta name='robots' content='index, nofollow'>
```

■ Tip: Login pages, admin panels, thank-you pages pe noindex lagao — Google pe nahi chahte na unhe!

<link rel='canonical'> — Original Page URL

Jab same content multiple URLs pe ho (www aur non-www, HTTP aur HTTPS) toh Google ko batao ki original/main URL kaunsi hai. Duplicate content penalty se bachata hai.

```
<!-- Yeh link tag hai, meta nahi — lekin SEO ke liye important! -->
<link rel='canonical'
href='https://yoursite.com/html-notes'>
```

```
<!-- Isse Google samjhega ki chahe URL kuch bhi ho, -->
<!-- original content yahan hai -->
```

■ Note: E-commerce sites pe canonical bahut important hai — same product multiple categories mein hota hai.

<meta http-equiv='refresh'> — Page Redirect

Kuch seconds baad automatically dusre page pe redirect kar do. Ya page ko refresh kar do.

```
<!-- 5 seconds baad google.com pe redirect -->
<meta http-equiv='refresh'
content='5; url=https://www.google.com'>
```

```
<!-- Har 30 seconds mein page refresh -->
<meta http-equiv='refresh' content='30'>
```

■ **Warning: http-equiv='refresh' avoid karo — user experience kharab hota hai. JavaScript use karo redirect ke liye.**

Open Graph Tags — Social Media Preview

Jab tum WhatsApp, Facebook, ya LinkedIn pe koi link share karte ho — ek preview card dikhta hai with image, title, description. Yeh Open Graph tags se aata hai. Facebook ne banaya tha, ab sab platforms use karte hain.

```
<!-- Basic OG Tags -->
<meta property='og:title' content='HTML Complete Notes'>
<meta property='og:description' content='Day 10 - Sigma Web Dev Course'>
<meta property='og:image' content='https://yoursite.com/preview.jpg'>
<meta property='og:url' content='https://yoursite.com/html-notes'>
<meta property='og:type' content='website'>
<meta property='og:site_name' content='CodeWithHarry Notes'>

<!-- Twitter Card (Twitter ka apna system hai) -->
<meta name='twitter:card' content='summary_large_image'>
<meta name='twitter:title' content='HTML Complete Notes'>
<meta name='twitter:description' content='Day 10 - Sigma Web Dev'>
<meta name='twitter:image' content='https://yoursite.com/preview.jpg'>
```

OG Property	Kya Dikhata Hai	Best Practice
og:title	Preview card ka title	60 chars se kam
og:description	Preview mein description	150-200 chars
og:image	Preview ka bada image	1200x630 pixels
og:url	Canonical page URL	Full URL with https
og:type	Content ka type	website / article / video
og:site_name	Website ka naam	Brand name likho

Complete <head> Template — Copy-Paste Ready!

Yeh ek complete <head> template hai jo tum apne har project mein use kar sakte ho:

```
<head>
<!-- 1. CHARSET — SABSE PEHLE -->
<meta charset='UTF-8'>

<!-- 2. VIEWPORT — Mobile ke liye -->
<meta name='viewport'
content='width=device-width, initial-scale=1.0'>

<!-- 3. TITLE — Tab aur Google mein dikhta hai -->
<title>Page Title | Website Name</title>

<!-- 4. SEO META TAGS -->
<meta name='description' content='150-160 chars description'>
<meta name='keywords' content='keyword1, keyword2, keyword3'>
<meta name='author' content='Tumhara Naam'>
```

```

<meta name='robots' content='index, follow'>

<!-- 5. CANONICAL URL -->
<link rel='canonical' href='https://yoursite.com/page'>

<!-- 6. OPEN GRAPH — Social Media Preview -->
<meta property='og:title' content='Page Title'>
<meta property='og:description' content='Page description'>
<meta property='og:image' content='https://yoursite.com/img.jpg'>
<meta property='og:url' content='https://yoursite.com/page'>
<meta property='og:type' content='website'>

<!-- 7. TWITTER CARD -->
<meta name='twitter:card' content='summary_large_image'>
<meta name='twitter:title' content='Page Title'>
<meta name='twitter:image' content='https://yoursite.com/img.jpg'>

<!-- 8. CSS LINK (aane wala topic) -->
<link rel='stylesheet' href='style.css'>
</head>

```

■ Tip: Yeh template save kar lo — CSS aur JavaScript seekhne ke baad bhi yeh same rahega, sirf kuch cheezein add hongi!

PART 3 — Real Life Blog Page Structure

Blog Page ka Real Structure kya hota hai?

Jab tum CodeWithHarry, Medium, ya koi bhi blog website kholte ho — unka HTML structure andar se kuch aisa hota hai. Yeh structure industry standard hai — saari professional websites isi pattern ko follow karti hain.

Blog Page ka Visual Structure (Wireframe):

<header> – Logo + Navigation Menu	
<nav> Home About Blog Contact	
<main>	
<article> (Main Blog Post)	<aside> (Sidebar)
<header> Post title + date + author	Related Posts
<section> Post content / paragraphs	Categories
<figure> Post image + figcaption	Author Bio
<blockquote> Quote from expert	Advertisement
<section> Comments section	
</article>	</aside>
</main>	
<footer> – Copyright Links Social Media Address	

Har Part ka Role:

<header> (Page Level): Site ka brand identity — logo, site name, aur main navigation. Yeh har page pe same rehta hai. User pehli nazar mein yahan dekhta hai.

<nav>: Saite ke important sections ke links — Home, Blog, About, Contact. Screen readers yahan se directly jump kar sakte hain.

<main>: Page ka dil — yahan ka content hi Google index karta hai primarily. Ek page mein sirf ek <main>.

<article>: Blog post khud — title se lekar last word tak. Agar RSS feed mein ya kisi aur site pe share karo toh bhi make sense kare.

<article> ka <header>: Post ka title, author name, publish date, category — yeh post ka apna header hai, page ka nahi.

<section> (Content): Post ke andar thematic sections — jaise 'Introduction', 'Main Points', 'Conclusion'. Har section mein heading honi chahiye.

<figure> + <figcaption>: Post ki featured image ya infographic — caption ke saath. Google images mein bhi rank hota hai figcaption se.

<blockquote>: Kisi expert ya doosre source ka quote — cite attribute mein source URL dena best practice hai.

<aside> (Sidebar): Related posts, categories, author bio, ads — yeh main content ka part nahi, supplementary hai.

<footer> (Page Level): Copyright, privacy policy, social media links, contact info — site ka bottom. Address tag contact info ke liye.

Example Blog Page — 'Learn HTML in 10 Days'

Yeh ek complete, real-world blog page ka HTML code hai. Ise copy karke apne VS Code mein chalao aur dekho kaise render hota hai. Har cheez properly structured hai — SEO tags, semantic layout, sab kuch!

■ Tip: Yeh code abhi CSS ke bina plain dikhega — lekin structure bilkul professional hai. Jab CSS seekh jaoge toh yahi code ek beautiful blog ban jaayega!

Code Part 1 — <head> Section (SEO + Meta Tags)

```
<!DOCTYPE html>
<html lang="en">

<head>
  <!-- Character Encoding -->
  <meta charset="UTF-8">

  <!-- Mobile Responsive -->
  <meta name="viewport"
    content="width=device-width, initial-scale=1.0">

  <!-- SEO Meta Tags -->
  <title>Learn HTML in 10 Days | TechBlog</title>
  <meta name="description"
    content="Complete guide to learn HTML in 10 days.
    Covers all tags from basic to advanced with
    examples. Perfect for beginners.">
  <meta name="keywords"
    content="HTML, learn HTML, HTML tutorial,
    web development, beginner HTML">
  <meta name="author" content="Shauray Sharma">
  <meta name="robots" content="index, follow">
```

```

<!-- Canonical URL -->
<link rel="canonical"
href="https://techblog.com/learn-html-10-days">

<!-- Open Graph: WhatsApp/Facebook preview -->
<meta property="og:title"
content="Learn HTML in 10 Days">
<meta property="og:description"
content="Complete beginner's guide to HTML.">
<meta property="og:image"
content="https://techblog.com/html-cover.jpg">
<meta property="og:url"
content="https://techblog.com/learn-html-10-days">
<meta property="og:type" content="article">

<!-- Twitter Card -->
<meta name="twitter:card"
content="summary_large_image">
<meta name="twitter:title"
content="Learn HTML in 10 Days">
<meta name="twitter:image"
content="https://techblog.com/html-cover.jpg">
</head>

```

Code Part 2 — <header> + <nav>

```

<body>

<!-- ===== HEADER ===== -->
<header>
<h1>TechBlog</h1>
<p>Web Development Tutorials in Hindi</p>

<nav>
<a href="/">Home</a>
<a href="/blog">Blog</a>
<a href="/tutorials">Tutorials</a>
<a href="/about">About</a>
<a href="/contact">Contact</a>
</nav>
</header>

```

Code Part 3 — <main> + <article> (Blog Post Content)

```

<!-- ===== MAIN CONTENT ===== -->
<main>

<!-- Blog Post Article -->
<article>

<!-- Article ka apna header -->
<header>
<h2>Learn HTML in 10 Days – Complete Guide</h2>

Is Blog Page mein Use Kiye Gaye Tags — Summary

Tag	Kahan Use Kiya	Purpose
<html lang='en'>	Root element	Language declare kiya — English
<meta charset>	Head mein sabse pehle	UTF-8 encoding
<meta viewport>	Head mein	Mobile responsive
<meta description>	Head mein	Google search snippet
<meta keywords>	Head mein	SEO keywords
<meta author>	Head mein	Author info
<meta robots>	Head mein	Google ko index karne ki permission
<link canonical>	Head mein	Duplicate content avoid
<meta og:*>	Head mein	WhatsApp/Facebook preview
<meta twitter:*>	Head mein	Twitter card preview
<header>	Page top + Article top	2 baar — page aur article dono ka
<nav>	Header + Footer	2 baar — main nav aur footer nav
<main>	Page ka center	Sirf ek baar — primary content
<article>	Main ke andar	Blog post — independent content
<section>	Article ke andar	4 sections — intro, plan, tips, FAQ
<figure>	Featured image + author	2 baar — media wrapper
<figcaption>	Figure ke andar	Image description

<code><blockquote></code>	Article ke andar	Expert quote with source
<code><cite></code>	Blockquote ke andar	Quote ka source
<code><aside></code>	Main ke andar	Sidebar — related posts, author
<code><footer></code>	Page bottom + Article	2 baar — page aur article dono ka
<code><address></code>	Footer ke andar	Contact information
<code><time></code>	Article header + footer	Publish date machine-readable
<code><mark></code>	Content mein	Important text highlight
<code><details>+<summary></code>	FAQ section	Collapsible FAQ items

■ Tip: Yeh blog page code apne VS Code mein likh ke chalao — CSS add karne ke baad yeh bilkul ek real website jaisi dikhegi!

Made with love for Shauray Sharma — Sigma Web Dev Course ke saath HTML seekhte raho!
